

I am shocked to find out that measurements taken in the BPL trial communities show interference of 9 S-units in the 160 through 6 meter spectrum range. I am an amateur license holder (KB1HQN) and RACES radio operator for the town of Acton, MA, and I depend on bands in this frequency range to provide emergency communication services to the town. Please do not authorize this technology, which has now been shown to cause extremely harmful interference to amateur and short wave communications.
